■ Commission SF2M « Coulée et Solidification » (JARRY)

■ Semi-finished products

- continuous, semi-continuous, ingots (casting)

CC of steel

semi-CC of aluminum

ingot casting of steel

■ Near-net-shape products

- expendable: sand, plaster, shell, plaster, investment, lost foam (casting)
- non-expendable: centrifugal, semi-solid, die, permanent mold (casting)

sand casting of steel

cast engine block

■ Assembly

- welding (TIG, MIG, MAG, laser, ...)
- soldering, brazing

tungsten inert gas welding

investment shell

cast turbocharger rotor

- Part integrity (cracks, misruns, ...)
- Structure selection (columnar, equiaxed, dendritic, eutectic, ...)
- Phase selection (nature and size)
- Crystallographic texture (fiber)
- Segregation (inverse, buoyancy forces, grain sedimentation, intergranular, interdendritic, freckles, ...)
- Porosity (hot spot, shrinkage, gas)
- Residual stresses
- Hot tears

segregation map in
forge ingot

crystal" turbine blade

columnar-to-equiaxed transition

hot tear in weld

■ Structures formed from a binary melt

- dendritic, $l_1 \rightarrow \alpha + l_2$ (monovariant reaction),
- peritectic, $l + \alpha \rightarrow \beta$ (invariant reaction),
- eutectic, $l \rightarrow \alpha + \beta$ (invariant reaction),
- congruent, $l \rightarrow \alpha$ (invariant reaction),
- monotectic, $l_1 \rightarrow l_2 + \alpha$ (invariant reaction).

■ Selection and fraction of structures and phases are influenced by

- alloy composition (industrial = multicomponent),
- departure from thermodynamic equilibrium (nucleation and growth undercooling),
- diffusion in phases (with $D^s \ll D^l$),
- phase flow (melt and solid),
- heat flow (temperature gradient, isotherm velocity).

Dendritic
(cast AlMgFeSi)

$Al_3Ni + Al$

Al_3Ni_2

Al_3Ni

Peritectic
(atomized NiAl)

Eutectic
(cast AlSi)

■ Segregations form due to

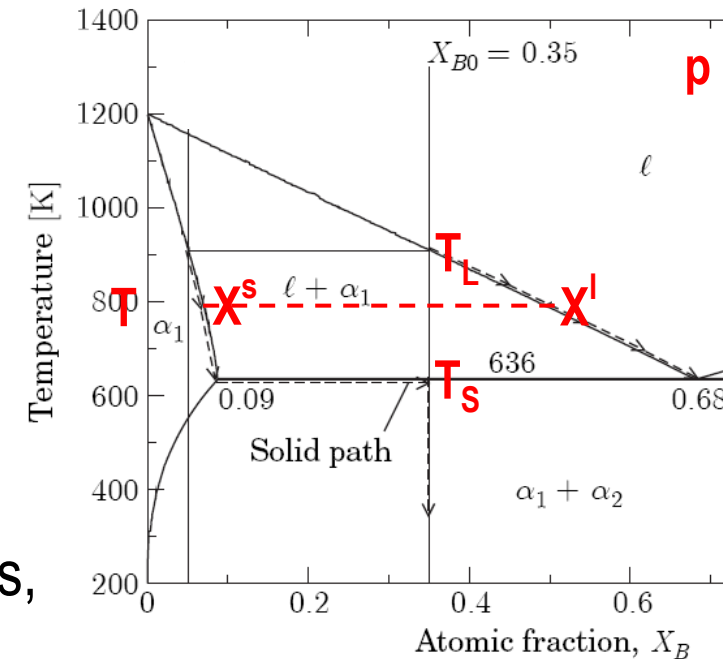

- thermodynamic equilibrium between phases with different solubility of species, defined by the segregation coefficient $k=(X^s/X^l)_{T,p}$

■ Main outputs of segregation studies

- composition profile and average composition of phases,
- fraction of structures and phases,
- fraction of phases in each structure,
- solidification path (above information as a function of temperature from T_L to T_S)

■ Simple examples of solidification paths, with common assumption a uniform liquid composition ($D^l \gg 0$)

- Lever Rule (LR): equal chemical potentials of all species in all phases ($D^s \gg 0$)
- Gulliver-Scheil (GS): same as LR at the s/l interface with $D^s=0$
- Partial Equilibrium (PE): mixture of GS for substitutionals and LR for interstitials

■ Introduction

- Statistics, Processes & Defects
- Structures & Segregations
- Scales & Methodologies

■ Direct microscopic methodology

■ Indirect microscopic methodology

- Observations: electromagnetic levitation and atomization
- Kinetics modeling coupled with equilibrium calculations
- Applications and current extensions

■ Indirect macroscopic methodology

- Phase field modeling of microstructures

■ Direct macroscopic methodology

- CAFE modeling
- Application to ESRF observations
- Application to directionally solidified grain structure
- Application to a macrosegregation benchmark experiment

■ Perspectives

Direct microscopic methodology

- The phase field method tracks to phase interfaces
- Applications to solidification include quantitative studies on structure dynamics (PLAPP, Ecole Polytechnique, Palaiseau)

www.solidification.org

Directional solidification
in a dilute alloy

Non-faceted eutectic
structure

Equiaxed solidification in
pure substance

- Most developed models consider multicomponent alloys and multiple phase transformations coupled with thermodynamic databases (Code MICRESS, ACCESS, Aachen, DE)

- Biggest phase field result for a network of dendrites in Al-Si?

Size is given by the number of grid point: 4096x1024x4096
(only few cubic millimeters!)

Parallel computation with up to 4'000 GPUs and 16'000 CPUs, reaching 2 petaFLOPS

GPU = Graphics Processing Unit,
CPU = Central Processing Units,
petaFLOPS = 10^{15} Floating point
Operations Per Seconds

■ Concurrent multiple phase transformations

(Rappaz&Thévoz 1987, Wang&Beckermann 1993, Appolaire et al. 2008)

- Constant and equal density in all phases
- Uniform T with heat exchange rate Q
- Zones & phases defined by boundaries & interfaces
 - (0): $l^{(0)}$ (1): $s_1^{(1)}+l^{(1)}$
 - (2): $s_1^{(2)}+s_2^{(2)}+l^{(2)}$
 - (3): $s_1^{(3)}+s_2^{(3)}+s_3^{(3)}$
- Microstructure propagation at zone boundaries with growth kinetics
 - s_1 : dendritic
 - s_2 : peritectic
 - s_3 : eutectic
- Thermodynamic equilibrium at phase interfaces
- Unknowns: average composition and phase fractions
 - $l^{(0)}$ $l^{(1)}$ $s_1^{(1)}$
 - $l^{(2)}$ $s_1^{(2)}$ $s_2^{(2)}$
 - $s_1^{(3)}$ $s_2^{(3)}$ $s_3^{(3)}$

Average total mass

over phase (α):

$$\frac{\partial}{\partial t} (g^\alpha) = \sum_{\beta (\beta \neq \alpha)} (S^{\alpha\beta} \underline{v_n^{\alpha\beta}})$$

on interface ($\alpha\beta$): $\underline{v_n^{\alpha\beta}} + \underline{v_n^{\beta\alpha}} = 0$

Average solute mass

over phase (α):

$$g^\alpha \frac{\partial}{\partial t} (\underline{\langle w^\alpha \rangle^\alpha}) = \sum_{\beta (\beta \neq \alpha)} \left[S^{\alpha\beta} (\underline{w^{\alpha\beta}} - \underline{\langle w^\alpha \rangle^\alpha}) \left(\underline{v_n^{\alpha\beta}} + \frac{D^\alpha}{|\alpha\beta|} \right) \right]$$

on interface ($\alpha\beta$):

$$\underline{(w^{\alpha\beta} - w^{\beta\alpha})} \underline{v_n^{\alpha\beta}} + \frac{D^\alpha}{|\alpha\beta|} (\underline{w^{\alpha\beta}} - \underline{\langle w^\alpha \rangle^\alpha}) + \frac{D^\beta}{|\beta\alpha|} (\underline{w^{\beta\alpha}} - \underline{\langle w^\beta \rangle^\beta}) = 0$$

Average energy balance

Global heat balance:

$$\rho \frac{\partial \langle H \rangle}{\partial t} = \rho \sum_{\alpha} \left(\underline{\langle H^\alpha \rangle^\alpha} \frac{\partial g^\alpha}{\partial t} + \underline{g^\alpha} \frac{\partial \langle H^\alpha \rangle^\alpha}{\partial T} \frac{\partial T}{\partial t} + \underline{g^\alpha} \frac{\partial \langle H^\alpha \rangle^\alpha}{\partial \langle w^\alpha \rangle^\alpha} \frac{\partial \langle w^\alpha \rangle^\alpha}{\partial t} \right) = -h_c S^{\text{ext}} (T - T_{\text{ext}})$$

Additional relations and Unknowns

Geometry & Composition profiles assumptions: $S^{\alpha\beta}, |\alpha\beta|, S^{\text{ext}}$

Boundary conditions: h_c, T_{ext} Data: $D^\alpha, \Delta T_n^{s_\alpha}$

Thermodynamic equilibrium: $\langle H^\alpha \rangle^\alpha, \partial \langle H^\alpha \rangle^\alpha / \partial T, \partial \langle H^\alpha \rangle^\alpha / \partial \langle w^\alpha \rangle^\alpha$ ← ThermoCalc+Database

Interface: Equilibrium: $w^{\alpha\beta}$ ← Boundary: Growth kinetics: $v_n^{\alpha\beta}$

Solute balance: $v_n^{\alpha\beta}$ Solute balance & Continuity: $w^{\alpha\beta}$

Partial Derivative Equations: $g^\alpha, \langle w^\alpha \rangle^\alpha, T$

■ Containerless processing

- Controlled conditions, almost uniform temperature, observation of nucleation events

M : Marasli&Hunt 1996 Acta Mater.

- Regime I: Classical Fourier number analysis**
 The peritectic transformation controls the phase fractions due to diffusion in the solid phases. It is favored for lower cooling rates (larger particles).
- Regime II: Al_3Ni primary growth**
 Primary growth of Al_3Ni controls the phase fraction. It prevents the development of Al_3Ni_2 .
- Regime III: Al_3Ni_2 and Al_3Ni growth competition**
 Mixed regime where the peritectic reaction for Al_3Ni can catch-up with the dendritic reaction of Al_3Ni_2 and become primary when the cooling rate is increased.

Evidence of growth competition between phases formed from the melt

Current extensions: multicomponent alloys (AM1), multiple phase transformations (FeCCr)

Indirect macroscopic methodology

Two-phase model assuming $\langle \rho \rangle^s = \langle \rho \rangle^l = \rho_0 = \text{constant}$ and $\langle \mathbf{v} \rangle^s = 0$

Total mass conservation

$$\nabla \cdot \langle \mathbf{v} \rangle = 0$$

Average flow velocity

$$\langle \mathbf{v} \rangle = \langle \mathbf{v}^l \rangle = g^l \langle \mathbf{v}^l \rangle$$

Momentum conservation

$$\rho_0 \frac{\partial \langle \mathbf{v}^l \rangle}{\partial t} + \frac{\rho_0}{g^l} \nabla \cdot (\langle \mathbf{v}^l \rangle \times \langle \mathbf{v}^l \rangle) - \nabla \cdot (\mu^l \nabla \langle \mathbf{v}^l \rangle) + g^l \nabla p^l - g^l \rho \mathbf{g} + \frac{\mu^l}{K} g^l \langle \mathbf{v}^l \rangle = 0$$

Boussinesq approximation

$$\rho = \rho_0 [1 - \beta_{th} (T - T_0) - \beta_w (w^l - w_0^l)]$$

Carman-Kozeny permeability

$$K = (g^{l^3} \lambda_2^2) / (180 (1-g^l)^2)$$

Energy conservation

$$\rho_0 \left(\frac{\partial \langle H \rangle}{\partial t} + \langle \mathbf{v} \rangle \cdot \nabla \langle H \rangle^l \right) - \nabla \cdot (\langle \kappa \rangle \nabla T) = 0$$

Average enthalpy

$$\langle H \rangle = g^s \langle H \rangle^s + g^l \langle H \rangle^l$$

Solute mass conservation

$$\frac{\partial \langle w \rangle}{\partial t} + \langle \mathbf{v} \rangle \cdot \nabla \langle w \rangle^l - \nabla \cdot (D^l g^l \nabla \langle w \rangle^l) = 0$$

Average composition

$$\langle w \rangle = g^s \langle w \rangle^s + g^l \langle w \rangle^l$$

The FE method provides a solution for $\langle \mathbf{v} \rangle$, $\langle H \rangle$, $\langle w \rangle$, T

- A CA grid of square cells is superimposed on top of the FE mesh
- Topological links are defined between the FE nodes and the CA cells
- Quantity at cell v , ξ_v (e.g., $\langle v \rangle$, $\langle H \rangle$, $\langle w \rangle$, T), is computed from quantity at nodes n , ξ_n , thanks to interpolation coefficients c

$$\xi_v = \sum_n c_v^n \xi_n$$

- and oppositely,

$$\xi_n = \left(\sum_v c_v^n \xi_v \right) / \left(\sum_v c_v^n \right)$$

Nucleation algorithm

■ State index of cell v wrt structure (j), $I_v^{(j)}$

- 0: no growing structure
- 1: growing structure
- 2: structure growth over

■ Structure nucleation in cell v

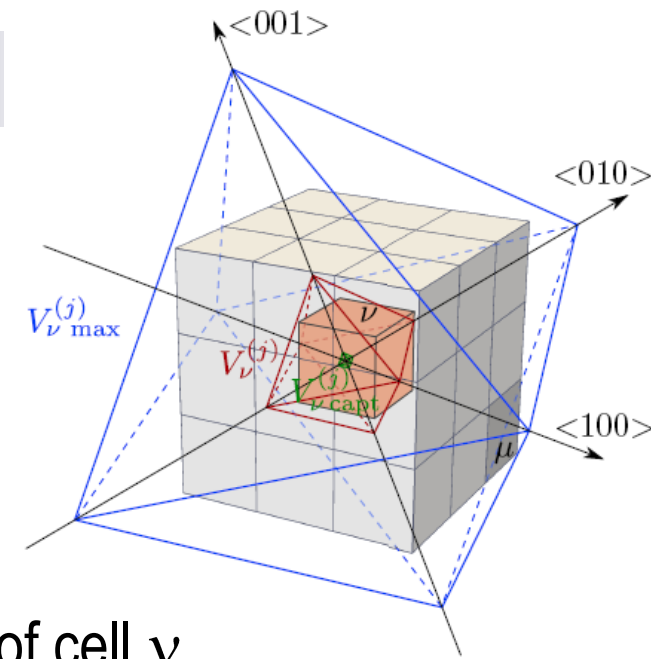

- Test for $I_v^{(j)} = 0$ prior to nucleation, change to $I_v^{(j)} = 1$ after nucleation
- Test for $\Delta T_v > \Delta T^{\text{nucl}(j)}_v$, the activation undercooling of the nucleation site of structure (j) located in cell v (undercooling = temperature difference between the local liquidus temperature, T_L , and the actual cell temperature, T_v)
- Initialization of a set of Euler angles $(\phi_1, \Phi, \phi_2)^{(j)}_v$ defining the 6 perpendicular $\langle 100 \rangle$ directions
- Growth center $C_v^{(j)}$ coincides with cell center C_{v0}
- Initialization of the lengths of the preferred $\langle 100 \rangle$ growth directions $R_v^{(j)\langle 100 \rangle}$ (for a $\langle 100 \rangle$ dendritic structure (j))

Growth algorithm

■ Structure growth in cell ν

- Increase of lengths $R^{(j)\langle 100 \rangle}_{\nu}$ by time integration of a phenomenological dendrite tip growth kinetics model that depends on local temperature, T_{ν} , composition, $\langle w \rangle_{\nu}$, and liquid velocity, $\langle \mathbf{v} \rangle_{\nu}$
- Calculation of volume associated with the growth shape of cell ν , $V_{\nu \text{ capt}}^{(j)} = f(C_{\nu}^{(j)}, R^{(j)\langle 100 \rangle}_{\nu})$, and the maximum volume required to capture all neighboring cells, $V_{\nu \text{ max}}^{(j)}$
- Calculation of the fraction of structure (j) in cell ν , $g_{\nu}^{(j)} = \min [(V_{\nu}^{(j)} - V_{\nu \text{ capt}}^{(j)}) / (V_{\nu \text{ max}}^{(j)} - V_{\nu \text{ capt}}^{(j)}), 1]$

■ Structure propagation to a neighboring cell μ

- Test for $I_{\mu}^{(j)} = 0$ prior to capture, test for liquid in cell μ , change to $I_{\mu}^{(j)} = 1$ after capture
- Test for the center of cell μ inside the growth shape associated with cell ν
- Propagation of the grain $(\phi_1, \Phi, \phi_2)_{\mu}^{(j)} = (\phi_1, \Phi, \phi_2)_{\nu}^{(j)}$
- Calculation of $C_{\mu}^{(j)}$, $R^{(j)\langle 100 \rangle}_{\mu}$, $V_{\mu \text{ capt}}^{(j)}$, $V_{\mu \text{ max}}^{(j)}$ and $g_{\mu}^{(j)}$

■ Nucleation kinetics

- Gaussian distribution of nucleation sites for a structure (j) as a function of the undercooling
 - Random selection of cells for assignment of nucleation sites
 - Random selection of Euler angles (ϕ_1, Φ, ϕ_2) for each nucleation site

■ Growth kinetics

- Phenomenological growth kinetics model for the shape associated to the cells
 - Ivantsov solution and marginal stability (dendrite tip kinetics)
 - Extension to account for the fluid flow intensity and direction with respect to the growth directions (assumed $\langle 100 \rangle$ for cubic materials)

■ Mushy zone solidification

- Tabulation of thermodynamic properties for each phase in structure (j) assuming a given solidification path (phase volume fraction, phase composition and phase enthalpy as a function of temperature and the average composition)

- Experimental set-up at the European Synchrotron Radiation Facility (ESRF, beam line ID19)

 X-Ray radiography

- **Distribution of inter- and intra-granular eutectic?**
Role of dendritic grain structure on eutectic distribution?

Measured parameters as inputs for simulations

- Characterization of the nucleation event for each grain: position x_i , y_i + orientation θ_i

- Measurement of the average dendrite arm spacing: $130 \mu\text{m}$
- Measurement of time evolution of the size of the mushy zone

■ Observation

$t = 5140 \text{ s}$

Grain structure

Composition

Eutectic

- The interaction of the liquid flow with the structure is computed
- The segregation pattern is linked with the grain structure and the eutectic fractions
- The Columnar-to-Equiaxed Transition (CET) is reproduced
- Inter- and intra-granular eutectics are partly distinguished
- Dendritic-to-eutectic transition is qualitatively retrieved

■ To be improved...

- **Direct tracking of the primary eutectic structure** is missing to reach better comparison with in-situ observation.
- **3D effects can not be fully neglected.**
- **Assessment of nucleation undercooling and better measurements of the temperature fields** would permit improved comparison.
- **Measurements of the composition field and the liquid velocity fields** are missing.
- Coupling with thermo-mechanics is required to give access to **shrinkage** and deformation.
- **Sedimentation of the grains** is not accounted for.

Improvement of nucleation kinetics required. Fragmentation?

■ Main scientific problems

- Nucleation laws not well characterized
- Fragmentation of mushy zone known as a source of crystals, but not understood
- Upscaling: modeling of a unique single grain with a direct microscopic method (e.g., phase field) for improving macroscopic models (e.g., CAFE)
- Coupling with deformation of the mushy zone during the formation of the solidification structure required (hot tear, shrinkage porosity, macrosegregation)
- Links with subsequent thermomechanical processing steps while inheriting from the solidification structure (e.g., PFZ formed upon homogenization heat treatment)
- Measurement of missing properties (e.g., interfacial energy and its anisotropy, mobilities)

■ Direct simulation of structures

- Need for more dedicated experiments with well controlled boundary conditions, with
- in-situ and post-mortem characterizations, to be compared with
- more integrated modeling with multiple scale physics and thermodynamic properties.
